1. Introduction

This report analyzes a public API to identify basic security risks such as authentication, access control, and data exposure.

1.API SECURITY ANALYSIS REPORT

API TESTED

API

<https://jsonplaceholder.typicode.com/>

3. TOOLS USED

Tools

- Web browser
- Postman (optional)
- Screenshot tool

TESTING PERFORMED

The following endpoints were tested:

- /posts (retrieves all posts)
- /users (retrieves user information)
- /posts/1 (retrieves a single post)

The API responses were analyzed to check whether security controls such as authentication and access restrictions are in place.

5. FINDINGS

1. No Authentication Mechanism

The API does not require login credentials, API keys, or tokens to access data.

Risk:

Unauthorized users can access all available data without restriction.

Impact:

This can lead to unrestricted data harvesting in a real-world system.

Recommendation:

Implement authentication mechanisms such as API keys or JWT (JSON Web Tokens).

2. Data Exposure

The API returns full datasets including user details and post content.

Risk:

Sensitive information is openly accessible to the public.

Impact:

In real systems, this could lead to privacy breaches or data misuse.

Recommendation:

Apply data minimization and restrict sensitive fields from API responses.

3. Lack of Access Control

All endpoints are accessible by any user without role restrictions.

Risk:

No differentiation between normal users and privileged users.

Impact:

Users could access data they are not authorized to view.

Recommendation:

Implement role-based access control (RBAC).

The API is useful for testing and development purposes but lacks essential security features such as authentication, authorization, and data protection mechanisms. These weaknesses make it unsuitable for production use.

6. CONCLUSION

7. EVIDENCE (SCREENSHOTS)
